Abstract: Species of galls of the gallflies Andricus aestivalis and Neuroterus (Pseudoneuroterus) macrop-
terus, new for Rumania, were discovered. There
were found also the commensals (males and females),
Periclistus caninae, in the galls of the species
Diplolepis spinosissima, and Synergus thaumacora
in the galls of Trigonaspis synapsis.

"Quantitative Uroculture."

Bucharest, Microbiologia, Parazitologia, Epidemiologia, Vol 8, No 1, Jan-Feb 1963, pp 87-90.

Abstract: Describes a new method for quantitative uroculture, which is superior to the classical methods in the sense that it can differentiate better between positive, false positive, and negative cultures. The method is simple and does not require excessive amounts of culture media or any materials that are hard to obtain. The complete results can be obtained in 48 hours, as with the classic methods, and are easily interpretable by clinicians.

Includes 2 tables and 8 Western references.

Pre-operative radiotherapy followed by wide lymphadeno-colpohysterectomy gives the least number of recurrences in the stages I and II. A study was made of 137 cases of recurrence; 15.3% occurred after treatment of incipient stages and 84.7% after advanced stages. The following types are distinguished: (1) 'incipient recurrence' when the lesion is small and permits mobilization of the vaginal dome with the adjacent parametrium; (2) 'advanced recurrence', with pronounced infiltration and immobilization of the vaginal dome. A careful monthly control associated with cystoscopy and rectoscopy for detecting 'incipient recurrences' which can benefit from treatment, is necessary. In 137 cases, 108 times parametrial recurrences were found and 101 times recurrence in the vaginal stump. The greater part of the parametrial recurrences (60%) occurred in the first 6 months. In a number of cases the 'recurrence' was rather a postoperative course of a pre-existing neoplastic infiltration, for the simple clinical diagnosis of the stage without histopathological examination, remains insufficient to define the actual stage precisely.

Title : Chemical-Technological Study of Fuel in R.R. Report II. Mechanical Treatment and Processing of Chemical-Technological Treatment of Fuel in R.R.

Orig Pub: Studii de cercetari chimice, 1956, 6, No 3, 265-279.

Abstract: It was found in the laboratory study on briquetting that the strength of briquets does not increase noticeably with the rise of pressure above 1500 kg

Card : 1/2

206

per sq. cm. The optimum moisture in post, producing strongest briquets depends on the granulometric composition of post and changes together with it. The temporary resistance to bending of briquets produced was 27 - 36 kg per sq. cm. 5% cracks or more was produced, when briquets were dropped from a height of 3 m on a cement floor. The briquets disintegrated when immersed in water. In the carbonization of post with a mixture of alcohol and benzene (1:1), the yield of volatile mass varied between 3.8 and 18.5% of the substance, 1957, 62203 for report I. - N. Ionescu.

ABS. JOUR. : RZKhin., No. 22 1959, No.

AUTHOR : Olteanu, E., Ionescu, N., and Fotache, E.
INST. : Not given
TITLE : On the Mechanical Concentration of Lignites

ORIG. PUB. : Rev Minelor, 9, No 2, 82-87 (1958)

ABSTRACT : The authors report on the testing of three processes for the concentration of Rumanian brown coals: separation according to particle size of brown coals and semicoke, separation in high-density organic solutions, and separation in high-density aqueous suspensions. The authors note that for the coals tested separation according to particle size is insufficient and the application of gravity-concentration methods is necessary.
